

Multimodal Emotion Recognition as Assessment **for** Learning in a Game-Based Communication Skills Training

Kiavash Bahreini
Rob Nadolski
Wim Westera

ECTEL Conference, September 16-19, 2014

Graz, Austria

Overview

1. Research area
2. The need for more and better communication skills
3. The problem with current communication trainings
4. Our – contribution to the - solution: *Communication Advisor*
5. Our R&D on assessment FOR learning with real-time multimodal emotion recognition
6. How to research the “evidence” of our solution?
7. Questions-discussion

1. Research area

1. Learner support (e.g., feedback) in serious games

Goal: Provide **timely** and **adequate** feedback

(feedback is based upon: cognitive states & affective states)

2. Learner support = Assessment **FOR** Learning (gather data + analysis)
 - multimodal emotion recognition from two sources (Face and Voice)
 - user choices (branching-stories, click-stream data)

[unobtrusive in-game assessment]

3. Application area PhD project Kiavash

- Communication skills

[align verbal and non-verbal: learn to express the right emotion at the right time]

Learner support towards

- Self-awareness of own behavior
- Enhancement of communication skills

(multimodal emotion recognition can ALSO detect progress (cognitive))

2. The need

More and better communication skills for life long learners/knowledge society

Communication-skills are given high priority at the EU level^{1, 2, 3, 4}

align verbal and non-verbal

1. <http://www.euca.eu/eu-project-erasmus-modes>
2. http://www.epc.eu/documents/uploads/pub_1160_skills_and_education.pdf
3. <http://softskillsproject.com/>
4. <http://www.fas.ie/en/pubdocs/SoftSkillsDevelopment.pdf>

3. The problem

- “teacher bandwidth” impedes timely feedback

- prolonged practice (tiresome)

4. Our solution: *Communication Advisor*(CA)

Digital *game-based* communication training

- guided practice based upon multimodal emotion recognition **and** performance

Aims to result into:

- timely feedback, more personalized, and more motivating training for learners

no replacement of teachers, but more efficient for teachers

[CA as front-end for labor-intensive f2f-training with teacher support]

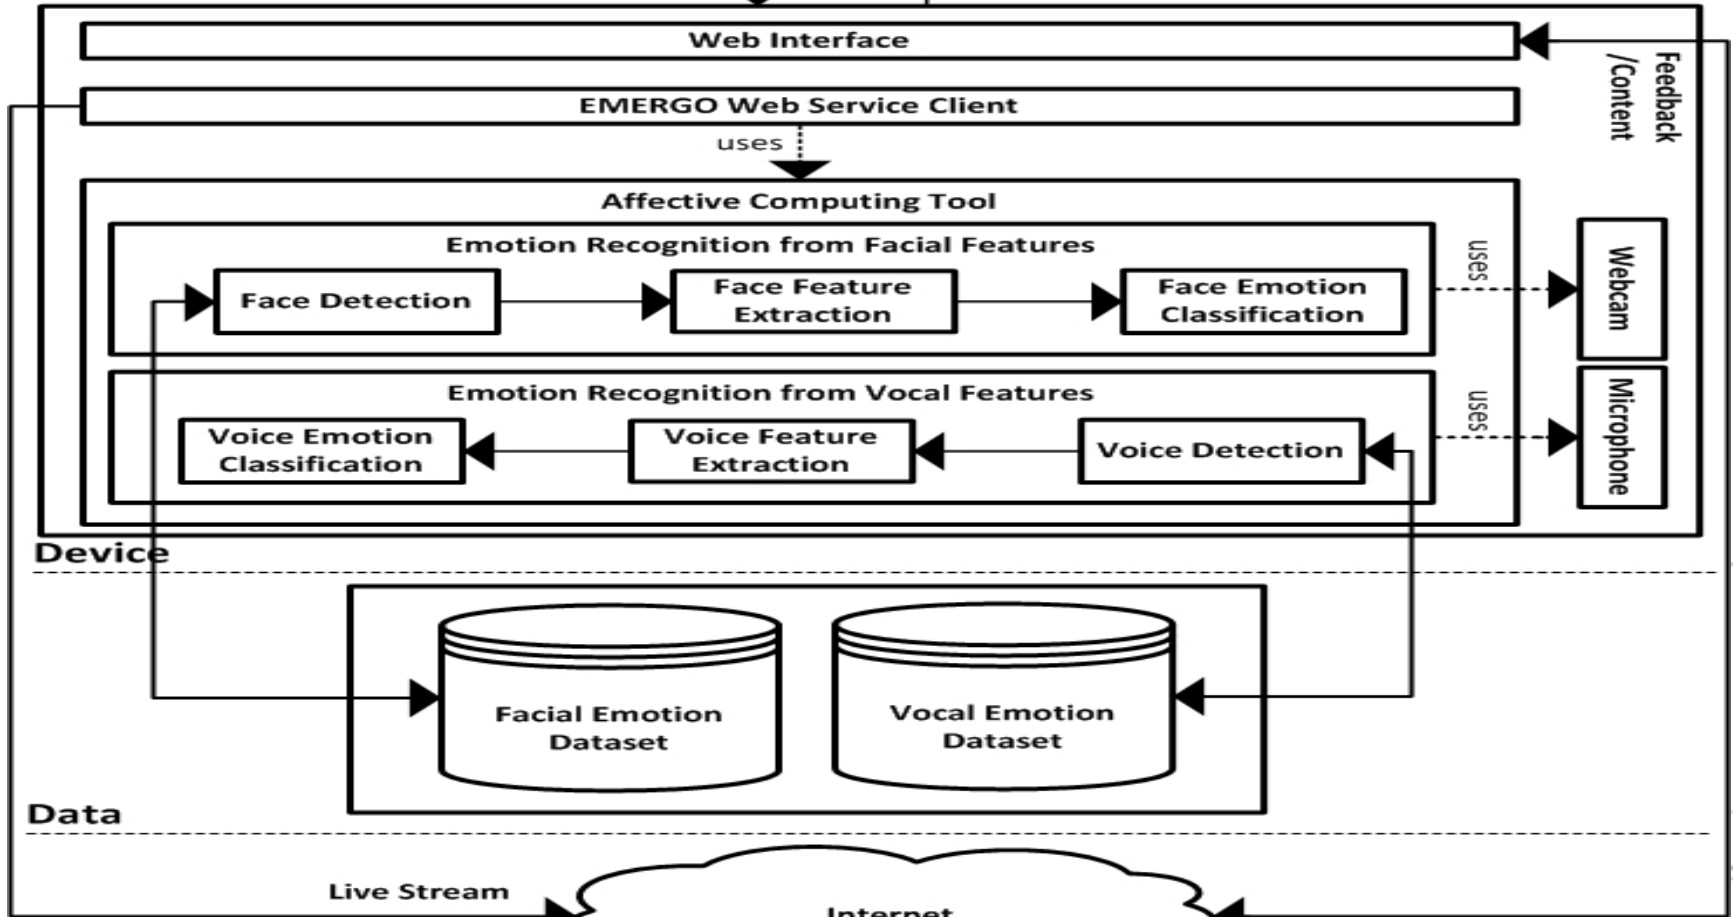

5. Our R&D on assessment FOR learning [with real-time Multimodal Emotion Recognition] *geared towards the Solution*

1. Webcams and microphones (consumer equipment) for gathering facial and vocal emotions
2. An overarching framework and **validated** software development of artifacts for analyzing facial and vocal emotions in real-time (FILTWAM)
[Research (R) and Development (D)]
3. Integration of the FILTWAM-software artifacts with a game-based engine EMERGO (a methodology and an open source game-based toolkit for the development and delivery of scenario-based serious games)
[Development (D)]

Layers of FILTWAM

Learner

Device

Data

Network

Application

5. Research of software validation for Multimodal Emotion Recognition - Study

- Participants (adults: 7 male, 5 female) had to do four consecutive tasks:
 - [1] Mimic (face) and speak loudly (voice) the requested emotion on the shown PowerPoint slide
 - [2] Mimic (face) and speak loudly (voice) the seven basic voice emotions on the shown PowerPoint slide (happy, sad, fear, disgust, surprise, angry, and neutral)
 - [3] Mimic and speak aloud the sender slides of the presented text transcript (both sender and receiver) taken from a good-news conversation
 - [4] As in task 3, but in this case the text transcript was taken from a bad-news conversation
- (in all cases, the recognized emotion was presented as Knowledge of Response-feedback: 'label of recognized emotion' was shown in green if it was the same as the requested emotion, in red if it differed from the requested emotion)

Face Emotion Recognition

Happy: 100%

Sad: 0%

Surprise: 0%

Fear: 0%

Disgust: 0%

Angry: 0%

Neutral: 0%

Happy Sad Surprise Fear Disgust Angry Neutral

Voice Emotion Recognition

```
1      1:?  2:Neutral  0.923
```

=== Predictions on test data ===

```
inst#  actual  predicted error prediction ()
  1      1:?  2:Neutral  0.677
```

=== Predictions on test data ===

```
inst#  actual  predicted error prediction ()
  1      1:?  2:Neutral  0.824
```

=== Predictions on test data ===

```
inst#  actual  predicted error prediction ()
  1      1:?  2:Neutral  0.677
```

=== Predictions on test data ===

```
inst#  actual  predicted error prediction ()
  1      1:?  1:Happy  0.923
```

Please read the following sentence once you click on OK

Cancel

OK

PowerPoint Slides

Sender Emotions: **Happy**

Actually, I have some really good news for you.

5. Results of software validation for Multimodal Emotion Recognition

1. The overall accuracy of our face emotion recognition software based on the requested emotions and the recognized emotions is 75%.
2. The overall accuracy of our voice emotion recognition software based on the requested emotions and the recognized emotions is 52%.

3. Validation of the Recognized Emotion by the Face and the Voice Emotion Recognition Software Modules

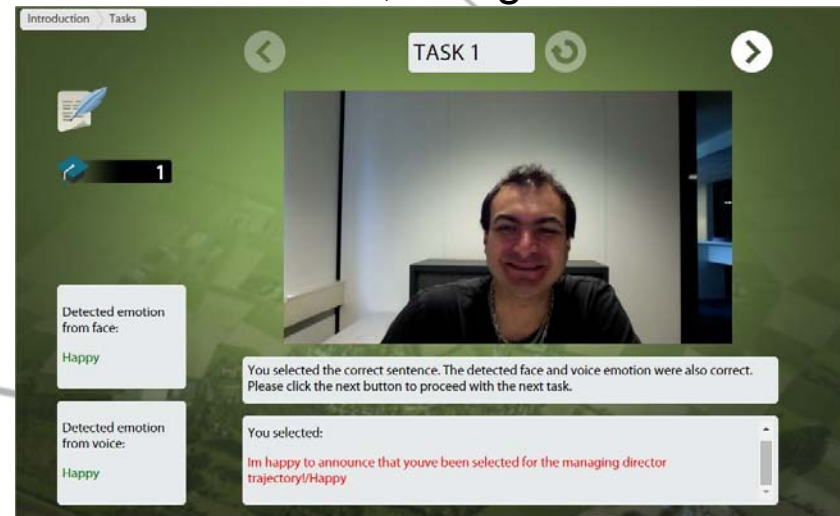

| Happy | Sad | Surprise | Fear | Disgust | Angry | Neutral | Total |
|-------|------|----------|------|---------|-------|---------|-------|
| 0.68 | 0.50 | 0.53 | 0.50 | 0.43 | 0.55 | 0.73 | 0.61 |

The overall Kappa value for the validation results of the face and the voice emotion recognition software modules for all the seven emotion for task 1, task 2, task3, and task 4.

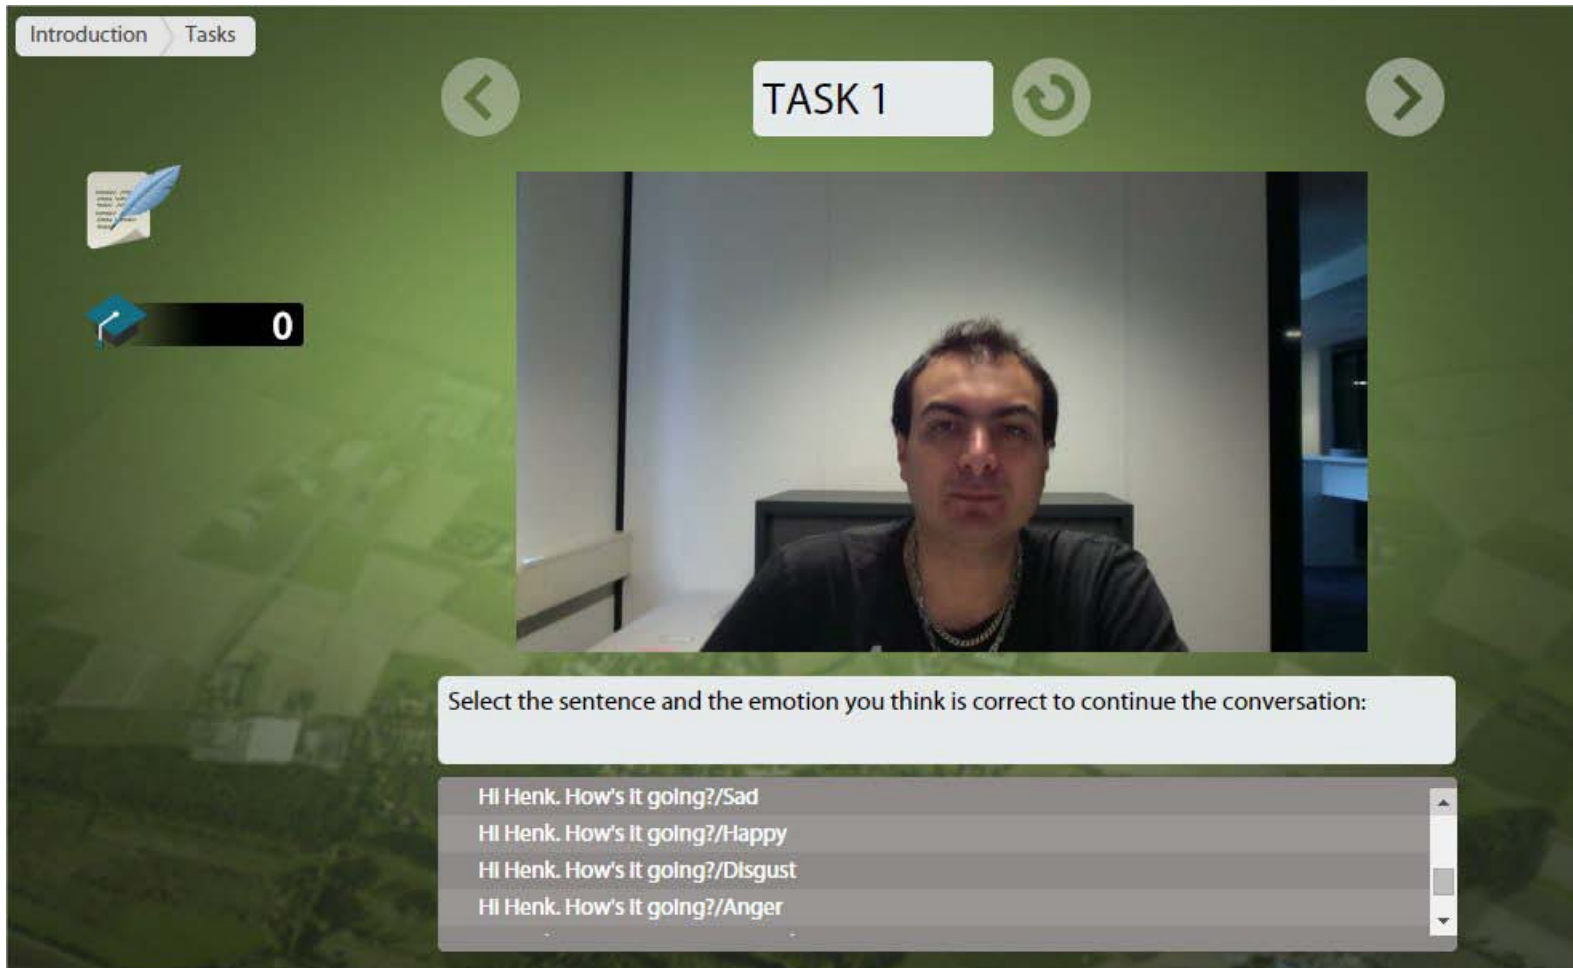

6. How to research the “evidence” of our Solution: proposal for Experimental design

- Five versions of *Communication Advisor* with immediate (timely) feedback
 - 1. [Cognitive] FB [on chosen alternatives]
 - 2. [Cognitive + one_sensorAffective] FB (face emotion detection)
 - 3. [Cognitive + one_sensorAffective] FB (voice emotion detection)
 - 4. [Cognitive + two_sensorAffective] FB (face & voice emotion detection)
 - 5. Control (= no FB)
- Twenty participants for each version (adults (female, male)) - randomized
- All versions contain ten micro stories/tasks + same reward mechanism
- Pre-test & Post-test on communication skills within all versions, using micro stories without feedback [→effectiveness] (scores)
- Motivation [→enjoyability] (questionnaire)
- Time investment [→efficiency] (time stamps)

6. Prototype Communication Advisor - 1

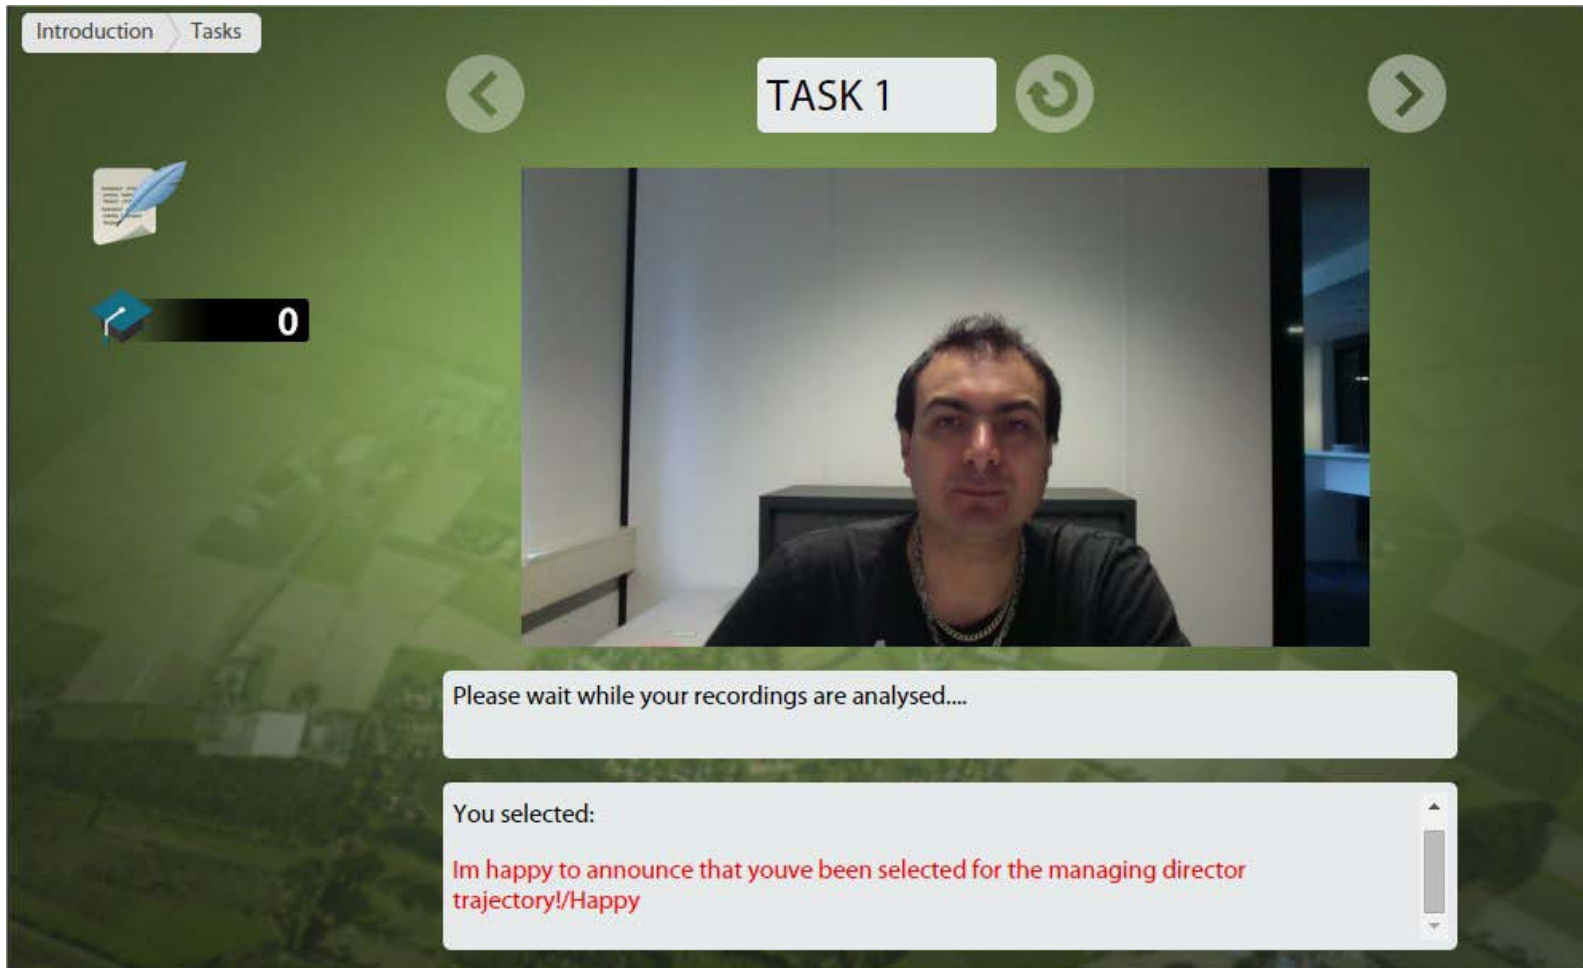

6. Prototype Communication Advisor - 2

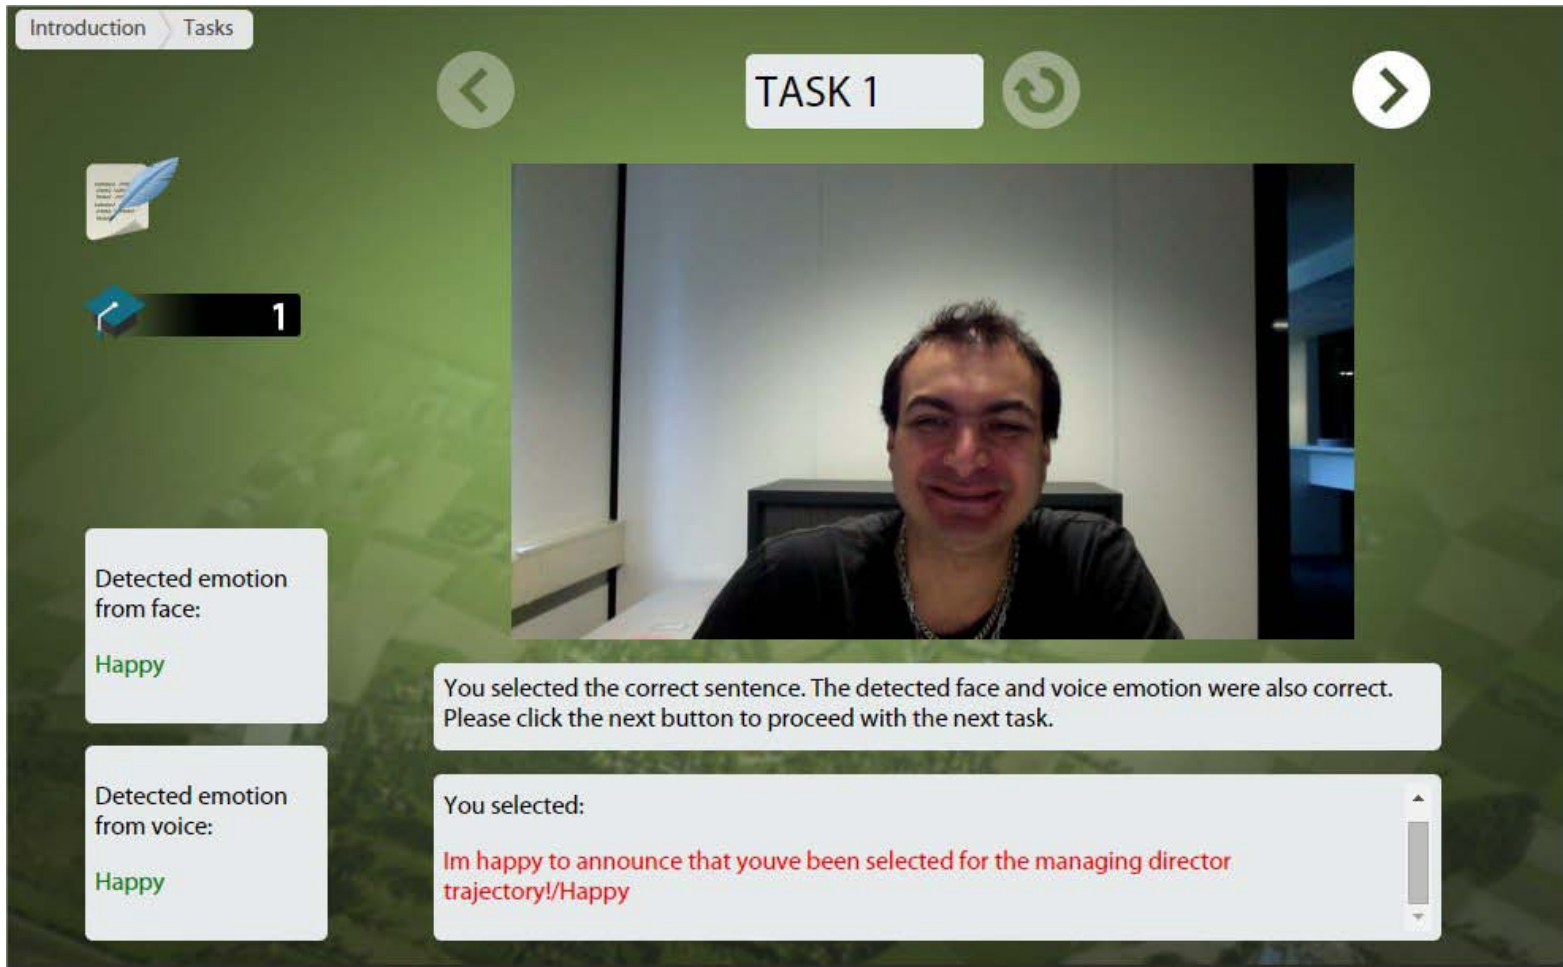

6. Prototype Communication Advisor - 3

6. Prototype Communication Advisor - 4

Introduction > Tasks

TASK 1

1

Detected emotion from face:
Happy

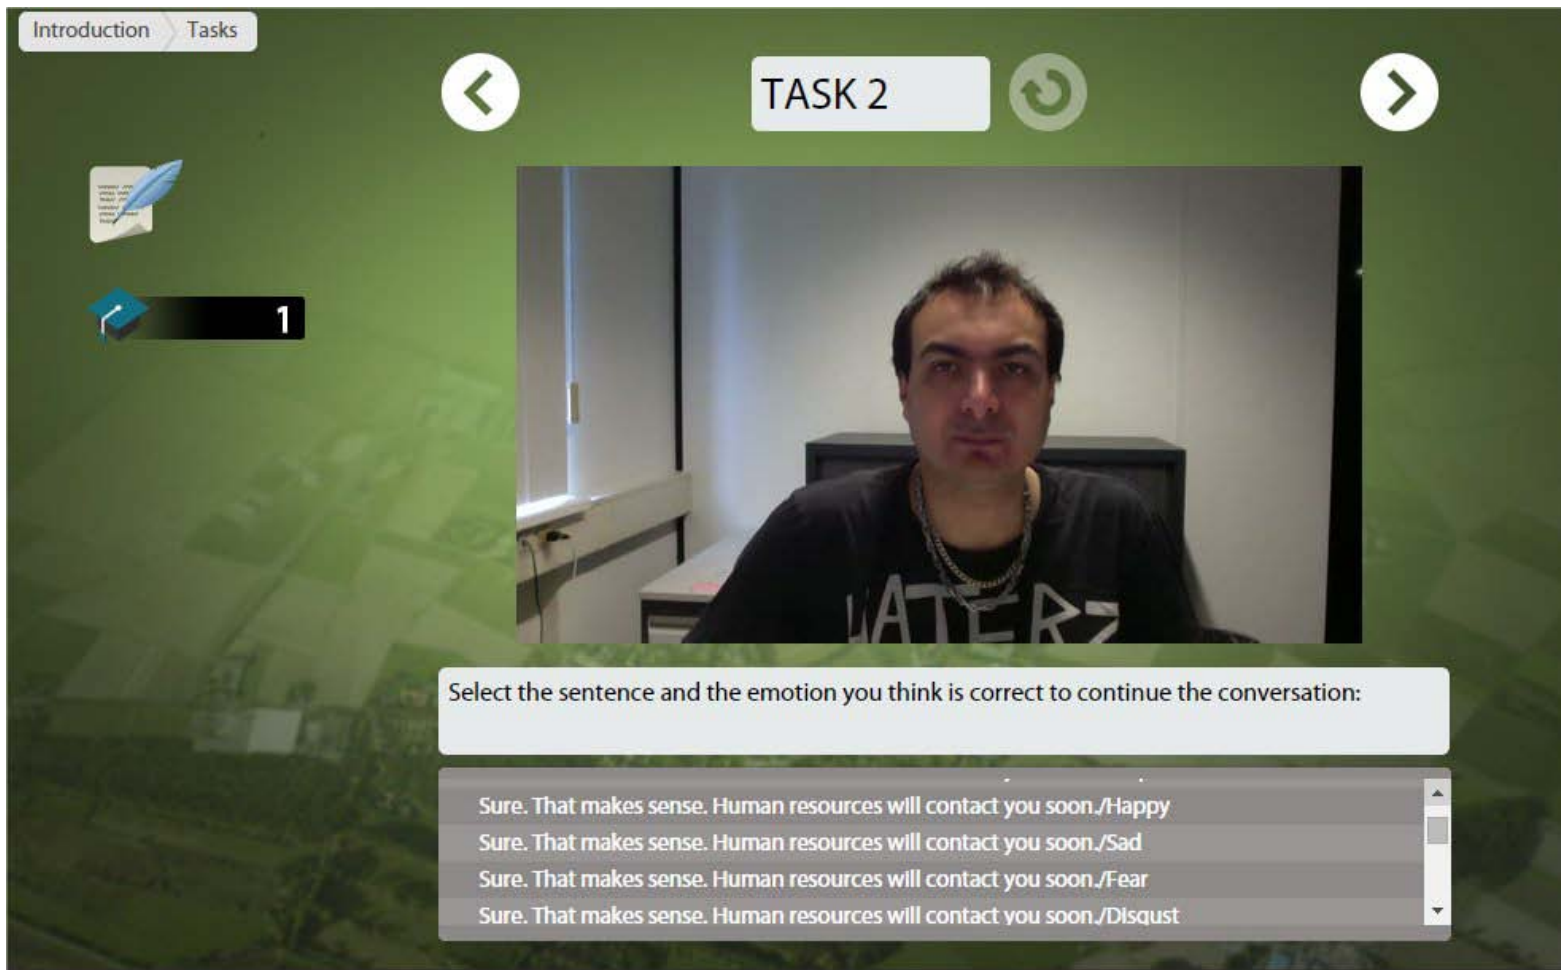

Detected emotion from voice:
Happy

You selected the correct sentence. The detected face and voice emotion were also correct. Please click the next button to proceed with the next task.

You selected:
Im happy to announce that youve been selected for the managing director trajectory!/Happy

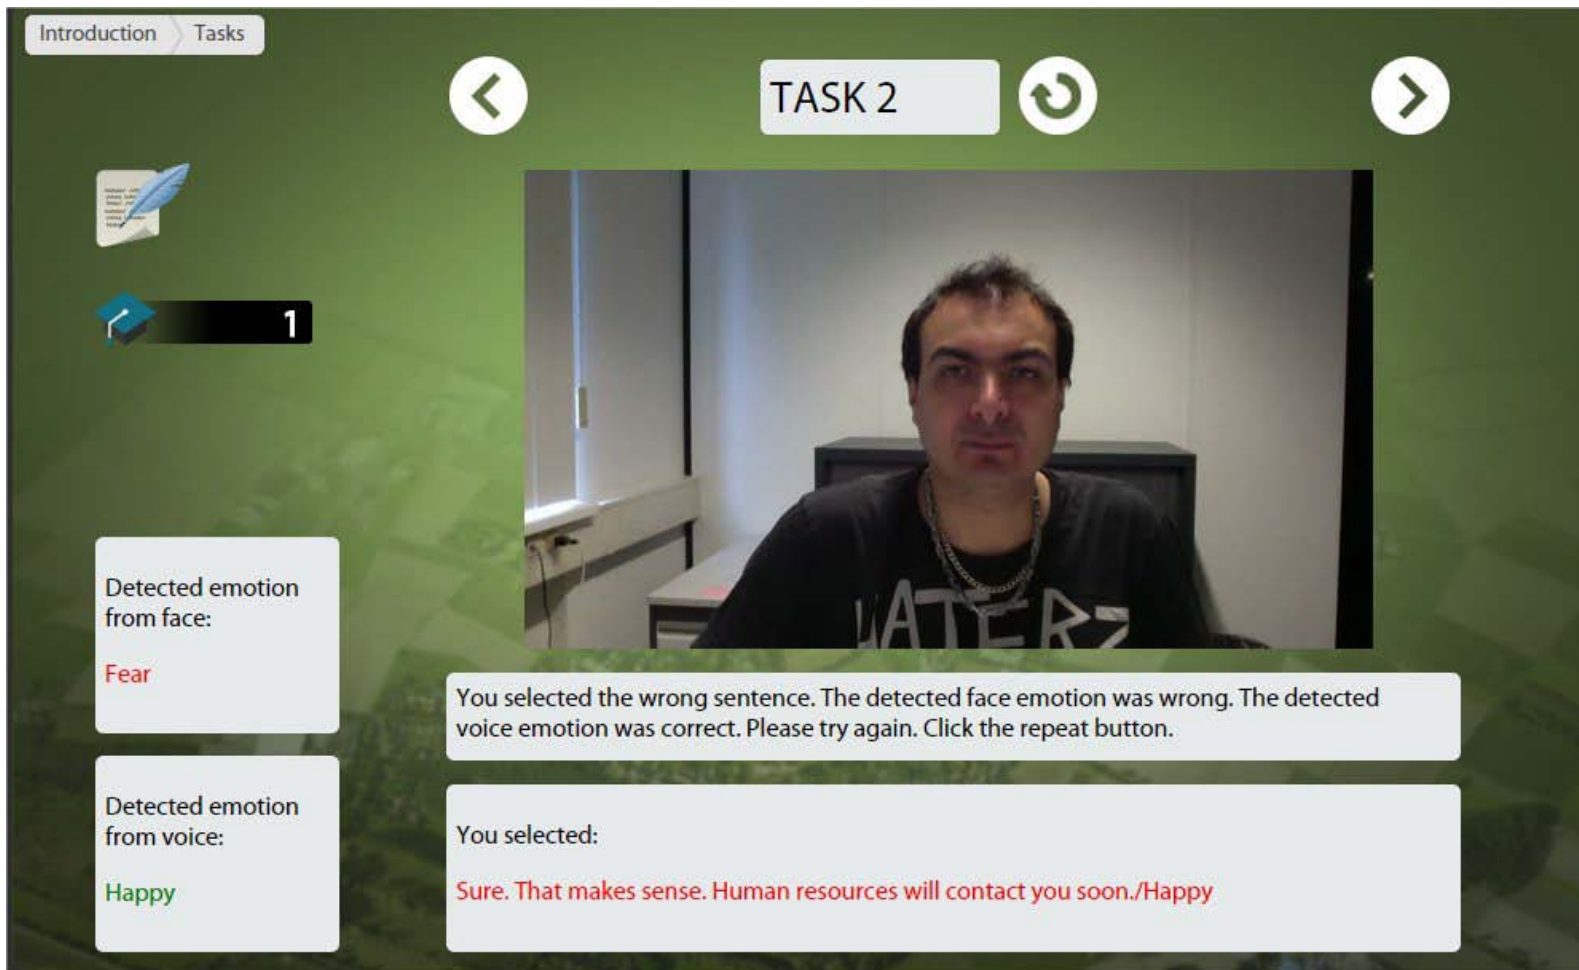

6. Prototype Communication Advisor - 6

The screenshot shows a game interface with a green background. At the top, there are navigation buttons: a left arrow, a 'TASK 2' label, a refresh icon, and a right arrow. Below the navigation, there is a video player showing a man in a black t-shirt with 'WATERS' on it. To the left of the video, there is a blue feather icon and a black box with a white '1'. Below the video, there is a text box with the instruction: 'Select the sentence and the emotion you think is correct to continue the conversation:'. Below this, there is a list of four options, each with a sentence and an emotion: 'Sure. That makes sense. Human resources will contact you soon./Happy', 'Sure. That makes sense. Human resources will contact you soon./Sad', 'Sure. That makes sense. Human resources will contact you soon./Fear', and 'Sure. That makes sense. Human resources will contact you soon./Disqust'. The list has a scrollbar on the right side.

6. Prototype Communication Advisor - 7

Introduction > Tasks

◀ TASK 2 ▶

1

Detected emotion from face:
Fear

Detected emotion from voice:
Happy

You selected the wrong sentence. The detected face emotion was wrong. The detected voice emotion was correct. Please try again. Click the repeat button.

You selected:
Sure. That makes sense. Human resources will contact you soon./Happy

7. Questions-Discussion

Thank you
